Angel Publishing

Angel Investment Research White Paper #4

Welcome to MoneyQuake 2026
Gold Beyond Belief: The Unthinkable Price Target That Will Reshape Global Wealth

“Gold has outlasted every empire, every currency, every lie.”
— Brian Hicks

Publisher’s Preface

White Paper #4: Gold Beyond Belief

If you’ve been following me for any length of time, you know one thing about me…

I don’t do cautious.

I don’t do consensus

And I certainly don’t do Wall Street’s “safe” little models that get you 7% a year if you’re lucky.

That kind of investing won’t protect you in what’s coming next.

Because we’ve crossed a line. A Rubicon.

The world has entered a financial era so unstable, so distorted, so utterly reckless… that the only way to prepare is to think bigger, bolder, and frankly — crazier — than the herd.

And if that makes me controversial, so be it.

I’ve been here before.

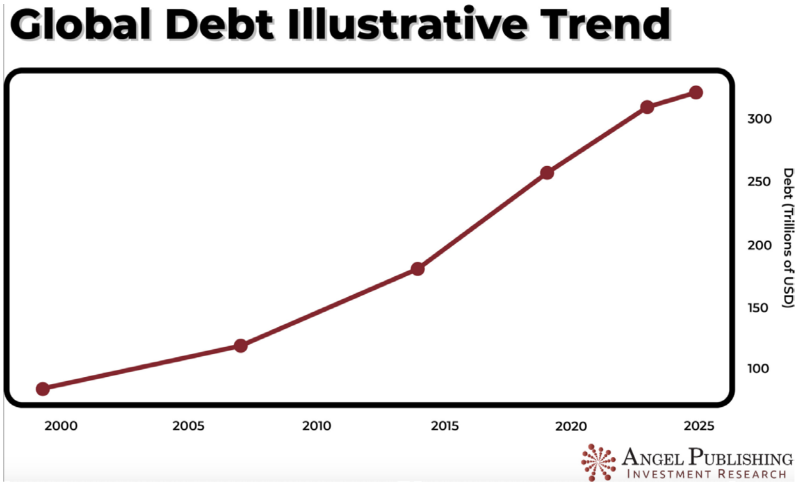
The MoneyQuake Is Here

Back in *White Paper #2* released in October 2024, I introduced the term "**MoneyQuake**."

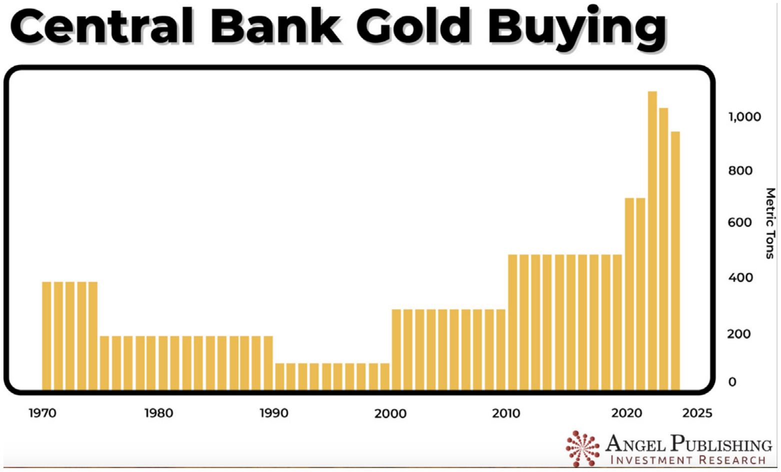
It wasn't just a catchy phrase. It was a way to describe a global phenomenon: when the tectonic plates of money, technology, energy, and power shift all at once — unleashing tremors, aftershocks, and finally a full-blown financial earthquake.

Since then, the tremors have only grown louder: U.S. debt exploding past $37 trillion coupled with long-term unfunded obligations approaching $90 trillion.

Debt outside the U.S. isn't better. Global debt now sits around $325 trillion and is growing every second.



As a result, central banks around the world are panic-buying gold.



Silver is breaking out to new record highs.

BRICS are openly plotting for gold-settled trades.

The petrodollar is cracking.

This is the **MoneyQuake** in real time.

And if *White Paper #2* was the warning, *White Paper #4* is the reckoning.

I Told You So — Again

When I published *White Paper #2*, I put forward what many called an outrageous price target for gold: **$16,402 per ounce**. It wasn't a guess. It was the logical endgame of the debt supercycle colliding with energy constraints, geopolitical fracture, and central banks scrambling for monetary sovereignty.

Back then, gold was still wrestling with $2,000. The mainstream laughed. Wall Street shrugged.

Look now: Gold has punched through new highs above $4,000, silver has awakened, and central banks are buying at the fastest pace in half a century. Being early — and bold — was the only way to be right.

Now I'm raising the stakes. Because **all bets are off.**

A New Bull Market — The Launch Point

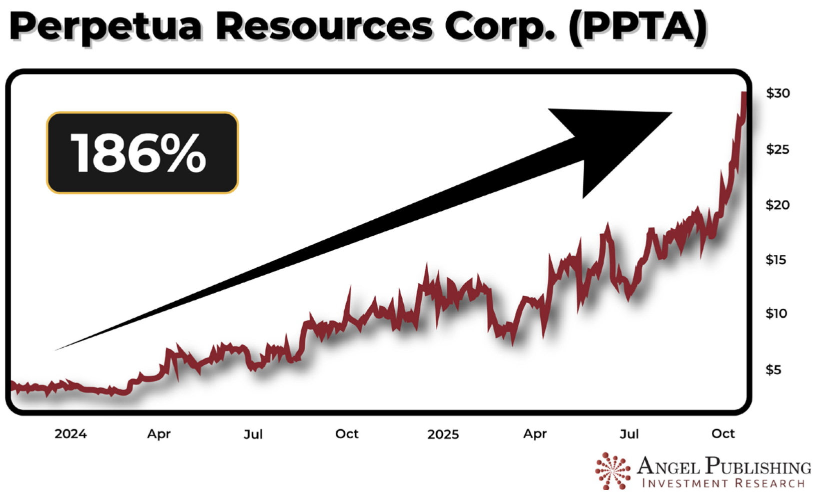
The launch point for this supercycle is **$2,000/oz gold** — our 1971 moment.

Back then, Nixon severed the dollar's last link to gold and triggered a chain reaction that carried gold from **$35** to **$850** by 1980 — an eruption of over **2,300%**. What happened once can happen again. Only this time, the MoneyQuake makes it bigger.

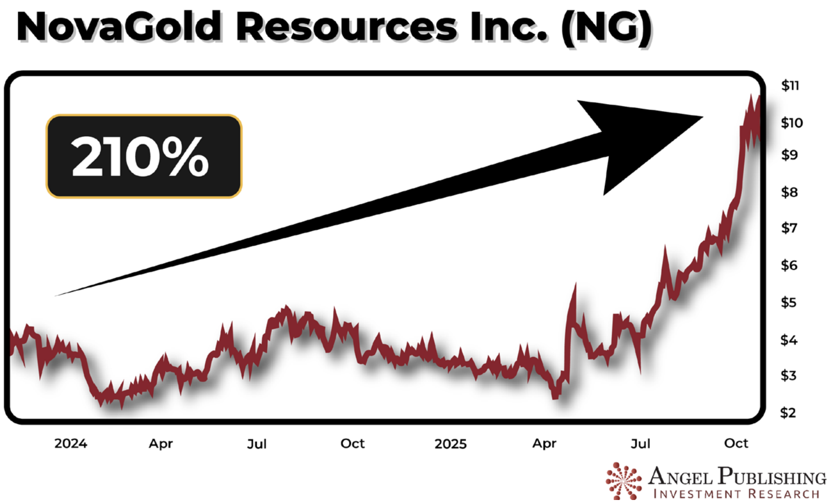
We've Crushed the Juniors (and We're Just Getting Started)

Before we charge into the reformation, a reminder: This isn't armchair theory. We've been in the arena — and we've been winning. Over the past 12–24 months, our junior/special-situations slate has torched the benchmarks:

- **Perpetua Resources (PPTA)** — An antimony and gold miner in Idaho… up 186% in 2025.

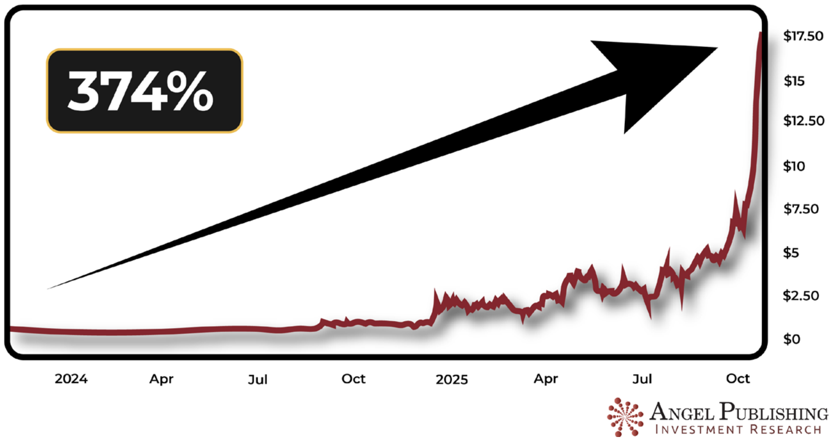


- **NovaGold (NG)** — Another gold miner in Alaska… a breakout year with a huge 210% rally just this year alone!



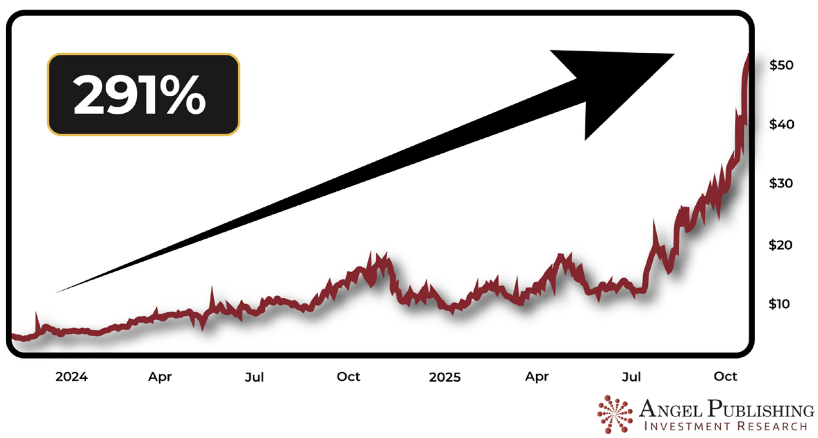
- **U.S. Antimony (UAMY)** — A face-melting, eye-popping year-to-date gain of 374% and a full one-year performance of 1,003% as strategic metals roared back.

United States Antimony Corp. (UAMY)



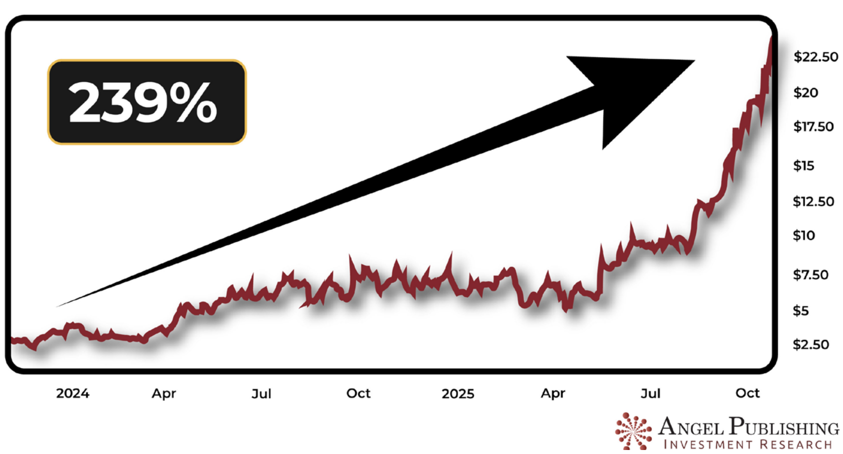
- **Idaho Strategic Resources (IDR)** — Another stealth multi-bagger of 291% for the year.

Idaho Strategic Resources Inc. (IDR)

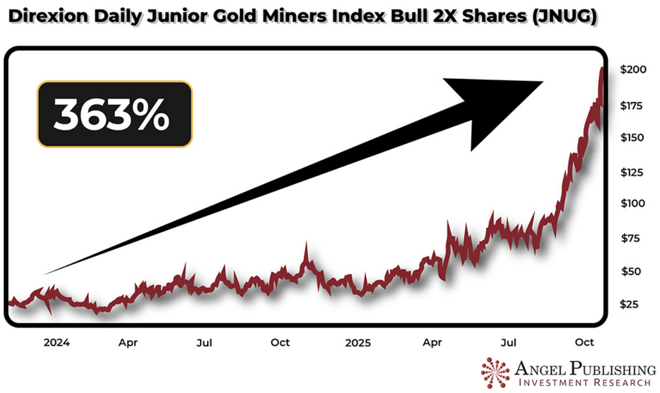


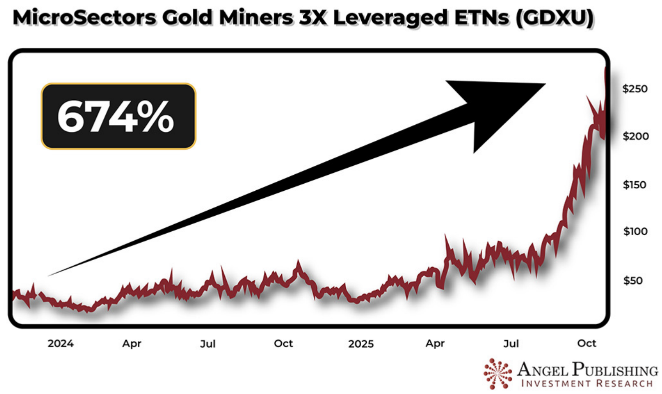
- **Coeur Mining (CDE)** — Technically surging as silver torque returns to the complex with a gain of 239% in 2025.

Coeur Mining Inc. (CDE)

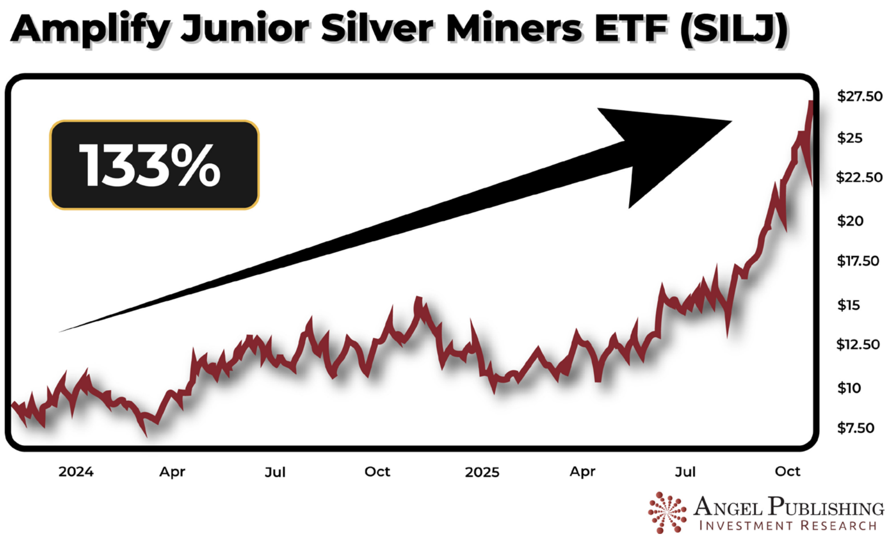


- **JNUG** and **GDXU ETFs** — Leverage monsters that delivered stunning triple-digit to near-10x type moves as juniors ripped — textbook MoneyQuake beta. Both are up 363% and 674% in 2025, respectively.





- **SILJ ETF** — Junior silver index proxy that posted powerful trailing returns as silver's coil began to spring. Up 133% this year!



These weren't lucky hops. They were **tactical strikes**: Get positioned early in the right juniors, add torque with selective leverage, and let the cycle do the heavy lifting. When the plates move, juniors don't just rise — **they detonate.**

But here is where it gets even better.

Let's take a look at where I think the price of gold is headed in the long run…

The Math No One Wants to See… Or Believe

- Gold launch point: **$2,000/oz**

- 1970s analog: **24.2857x**
- Today's projection: **$2,000 × 24.2857 = $48,571.43/oz**

Call it **$48,571.43** — precise, defensible, and inevitable when debt, scarcity, and tokenization collide.

Silver? Two engines: an **11.3959x** move (2001–2011 analog) and a **33.333x** move (1970s analog) applied to our **$49.50** baseline. That gets us to **$564.10** (base) and **$1,650.00** (stretch).

Those aren't guesses. They're **history's loudest echoes**, applied to a higher launch point in a more fragile monetary regime.

Why This Time Is Even Bigger

The 1970s were the rehearsal. Today is the main event:

- **Debt Spiral:** Over $37 trillion and compounding — interest costs crowding out the state.
- **Dollar Under Siege:** BRICS and Gulf trade moving toward gold settlement.
- **Central Banks Hoarding:** Fastest official buying in over 50 years.
- **Peak Gold:** Discoveries and grades plunging; capex and permitting choking supply.
- **Tokenization:** The instant monetization unlock — geology becomes money at the speed of code.

Each force could spark a bull market. Together, they're a **MoneyQuake.**

How This White Paper Unfolds

- **In Part I: The World at the Breaking Point**, we dissect the debt super-volcano, the fiat confidence collapse, and the fracturing geopolitics beneath the dollar system.

- **In Part II: The Great Gold Awakening**, we track the money flows: central banks hoarding, retail stirring, ratios (gold/Dow, gold/silver) screaming reset.
- **In Part III: The Era of Scarcity**, we prove Peak Gold and show how trillion-dollar vaults like Pebble Creek, Donlin, Back Forty, and Ruth are stranded — for now.
- **In Part IV: The Digital Gold Revolution**, we reveal the NatGold model: tokenized, verified reserves that **skip the shovel** and go straight to money.
- **In Part V: Beyond Belief — The Price Forecast**, we deliver the shock wave: **$48,571.43 gold, $564.10** base-cycle silver, **$1,650.00** stretch-cycle silver — numbers the old guard can't process until it's too late.

The Secret the Treasury Doesn't Want You to Know

The U.S. Treasury still marks America's gold at **$42/oz** — a balance-sheet fantasy in a world where spot has already re-rated and central banks are sprinting to metal. The gap between fiction and reality is the opportunity. When it closes, it will close **violently**.

This Is the Gold Reformation

The MoneyQuake isn't just about higher prices. It's a **reset…**

From fiat monopoly to **hard-asset sovereignty.**

From central bank theatrics to **geological truth.**

From petrodollars to **tokenized bullion.**

Gold is stepping back onto the throne — digital, divisible, unstoppable.

New Recommendations at the End — Load the Chamber

One more thing before you dive in: **At the end of this white paper** I'll unveil a **fresh strike list** — a tight set of **high-conviction recommendations** purpose-built for the next MoneyQuake leg. No hundred-name haystack. Just the **needles**: juniors with imminent catalysts, tokenization angles, asymmetric geology, and live news flow.

I expect several of these to **double within a year** and to **10x–100x** across the cycle if our thesis plays out. If you've been waiting for proof, the last 12–24 months were your proof. The next pages give you the tectonics. The back pages hand you the **weapons**. Don't skip them.

Understand that these are natural resource/commodity stocks — metals like silver, platinum, copper, gold… along with lithium, uranium, oil, and natural gas.

These commodities are in high demand because they will continue to power the expansion of AI and cryptocurrencies. They are natural twins in this wealth revolution — co-dependent on each other for their existence and growth.

And that brings me to FAST-41.

The **FAST-41** initiative — from Title 41 of the Fixing America's Surface Transportation (FAST) Act — was originally designed to streamline permitting for infrastructure, energy, and transportation mega-projects.

But in the final days of his first administration, Trump signed an amendment (or executive expansion) bringing **mining and critical minerals development** under the FAST-41 umbrella.

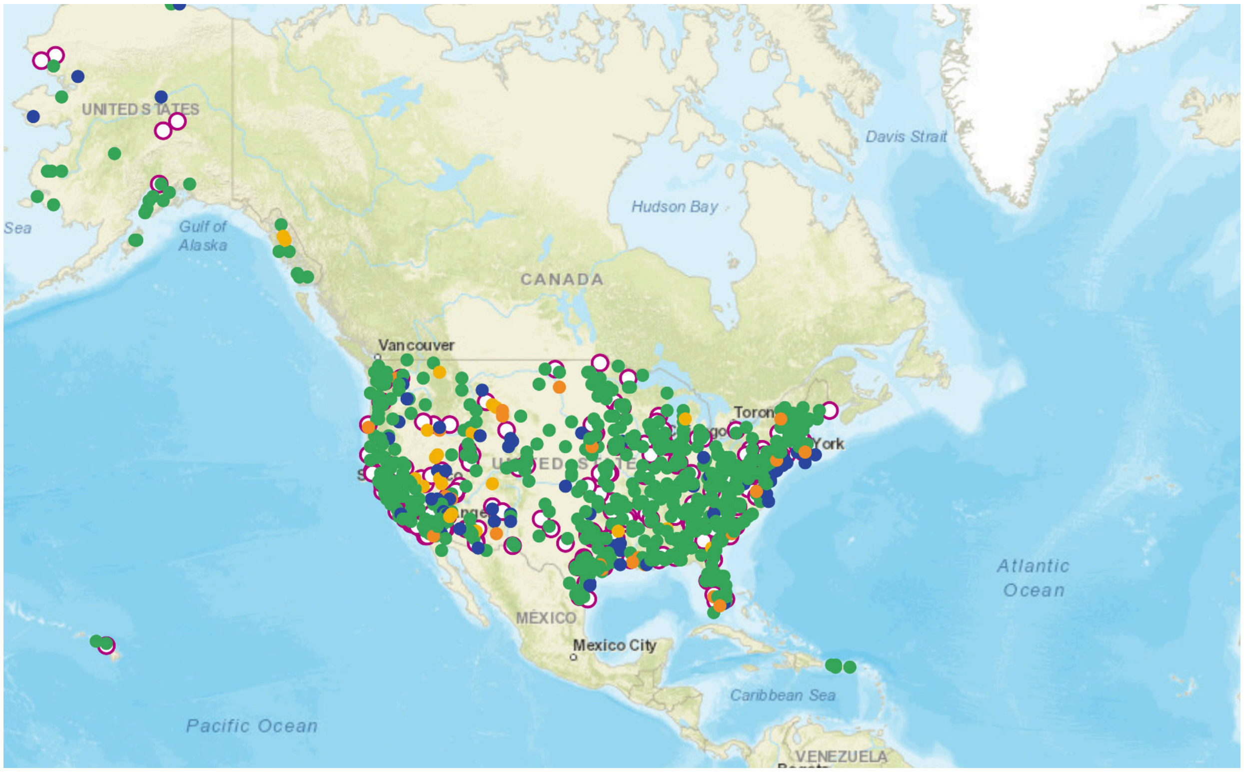
That means mining projects that qualify can now be put on a fast track: coordinated environmental review, transparent permitting timelines, interagency accountability, and publicly trackable dashboards. Essentially, mines now get the same preferential, streamlined status once reserved for highways, powerlines, and oil and gas pipelines.

The government's own **Federal Permitting Dashboard** has the full list of mining projects currently in the U.S.

Yes, it's a real dashboard that looks like this:

Project Map

The map below depicts all Federal infrastructure projects tracked on the Permitting Dashboard.



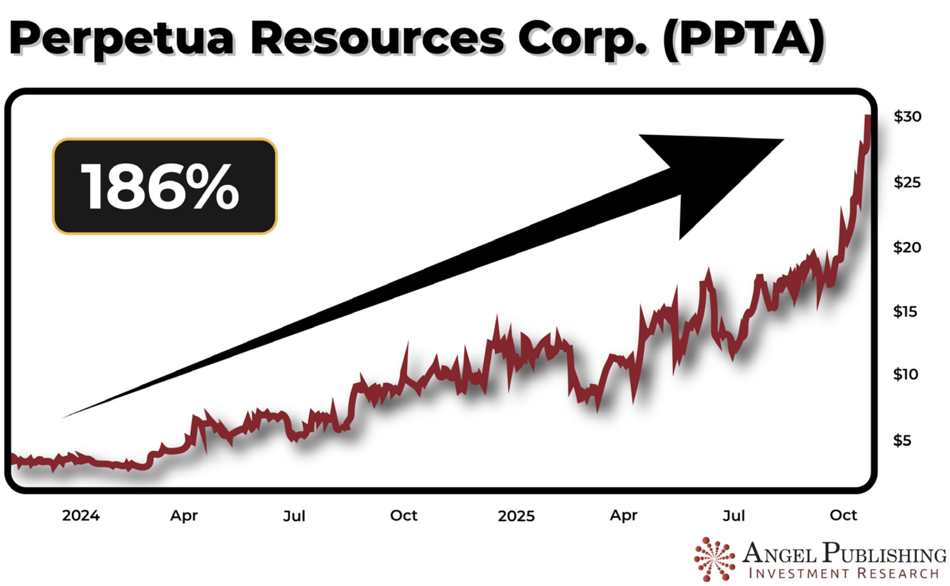
Every colored dot you see on the map represents a project. And every dot is potentially a millionaire-maker if you know what company to invest in.

And it has already paid massive dividends for investors in the know.

Take Perpetua Resources, for example.

Perpetua's Stibnite Gold Project in Idaho was explicitly posted to the **FAST-41 Permitting Dashboard** (Transparency Projects) following the March 2025 executive order on increasing American mineral production. The project has now **completed federal permitting**. This confers a public permitting timetable, tighter interagency coordination, and elevated accountability — the very "front-of-the-line" mechanics we want.

Perputua's stock has been on a rampage. Take a look:



But guess what?

Ninety-nine percent of investors haven't looked at it.

Because they don't understand what this really is.

This isn't just a policy tweak.

It's a wartime-level **land rush.**

A federal signal to "GO NOW" on America's most valuable mineral deposits — lithium, copper, gold, antimony, silver, rare earths, and uranium.

It's also the clearest insider clue I've seen since the early days of fracking.

And it's going to mint a fortune for those who act quickly.

You see, in 2025, the Trump administration moved aggressively on this front — adding a raft of key mining and critical minerals projects to FAST-41's "Covered" or "Transparency" lists.

The goal is clear: Slash permitting timelines (formerly 7–10 years) to 2–3 years, reduce red tape, and unlock domestic supply chains for gold, copper, lithium, silver, uranium, titanium, and more.

In fact, on March 20, Trump signed an executive order that added gold as a critical mineral to the United States. Gold mining stocks took off like a roman candle.

One such stock is a gold miner sitting on one of the largest gold deposits on the planet. The gold deposit is in Alaska… and holds an estimated 107 million ounces of stranded but verified gold.

The gold deposit has been certified by the Canadian NI 43-101 technical report.

When an NI 43-101 report confirms the gold in a deposit, it's considered gospel in the mining world. This isn't a back-of-the-napkin estimate — it's a legally binding, independently verified technical document prepared and signed by a **Qualified Person (QP)** under strict Canadian securities law.

The **NI 43-101** standard is the **gold standard** of the mining industry — the most respected and globally recognized certification for mineral resources and reserves. It provides the level of geological, engineering, and economic assurance that investors, exchanges, and major financial institutions rely on before putting serious money into a project. In short, when a deposit is NI 43-101 compliant, it's as close to an official "seal of truth" as it gets in mining and finance.

But even though the deposit was discovered in 1987… and a NI 43-101 has certified the massive gold deposit is there… those 107 million ounces of gold have remained stranded (unmined) in the ground because of bureaucratic red tape, environmental pushback, and bad press and legal challenges from tribal leaders.

That ends now.

The company's stock is up 166% for the year… but I think it'll gain 10,967%, making this current $1.50 stock a $164.50 behemoth gold play. I'll show you how to buy the stock at the end of this report.

There are more stocks to buy under the FAST-41 mandate!

I'll tell you more about them in a minute.

But first, let me explain why this matters for the MoneyQuake thesis: These mining projects don't just produce raw metal. They **fuel the expansion of AI, quantum computing, green energy, battery storage, and blockchain infrastructure** — industries that will define the next decade. Because technologies like AI and high-performance computing require huge volumes of copper, silver, rare earths, and other critical minerals, guaranteeing faster supply unlocks capacity bottlenecks and accelerates adoption curves.

FAST-41 is a matter of national security for the United States!

You see, as AI scales exponentially, data centers are no longer passive back-end infrastructure — they're power plants. According to BloombergNEF, electricity demand from AI training and inference workloads is expected to **quadruple over the next decade**, pushing data centers to become among the fastest-growing consumers of power globally. In 2035, they could demand up to **1,600 terawatt-hours** — roughly **4.4% of global electricity** — enough to make them a "country" on the energy map.

That energy doesn't come from thin air. To support those power needs, AI hubs require **massive infrastructure**: copper wiring, transformers, grid connectivity, cooling systems (which often use copper, aluminum, rare earth magnets, and specialty alloys), battery backups, and fuel for peaker plants. In short, every AI data center is a **metal and energy beast** — and in a world of constrained supply, whoever controls those materials has enormous leverage.

That's where **FAST-41 permitting becomes strategic, not just bureaucratic**. Under the new expansion of FAST-41, which includes critical minerals and mining projects, qualified mines are being pushed into the **front of the federal queue** for permits, environmental review, and interagency coordination. Projects that once sat in permit limbo for a decade may now move in **24–36 months** under the express lane. Washington understands: To stay competitive in AI, the U.S. cannot rely on foreign sources of copper, silver, gold, lithium, or uranium.

This isn't ideology — it's an arms race. China has long been dominant in refining, mining, and rare earths, giving it structural power over supply chains for advanced tech, clean energy, and military systems. If the U.S. remains dependent on China or foreign suppliers for the raw materials powering AI infrastructure, it cedes control — and security — to foreign hands.

FAST-41 is America's counterpunch. By fast-tracking domestic mines, we're not just building supply — we're **defending sovereignty** in the AI era. The miners that emerge from the executive's fast lane will supply the wiring, processors, cooling, and backup power that keep AI engines alive. That's not mere investment potential — that's foundational infrastructure for national power. The companies that win in FAST-41 aren't speculation. They're strategic assets for the next technological superpower.

And mining stocks tied to FAST-41 winners are effectively being moved to the front of the line — their projects de-risked, timelines compressed, and upside multiplied.

We already know which miners have leapt into this accelerated category: Projects in gold, silver, copper, uranium, lithium, and antimony have secured FAST-41 status or transparency coverage. That means those companies are no longer stuck waiting 7–10 years for permits. They are now in the **express lane**, and smart investors betting on them stand to pocket explosive upside when the infrastructure to support AI, crypto, renewables, and national security resets.

Final Word

I don't write to soothe. I write to **warn** — and to **arm.**

The tremors are over. The aftershocks are here. The **MoneyQuake** has begun.

Gold $48,571.43. Silver $564.10 base. Silver $1,650.00 stretch.

Not price targets. **Seismic events.**

Get to the good, green grass first — and own the reformation.

Welcome to *Gold Beyond Belief* — the MoneyQuake in full force.

Part I: The World at the Breaking Point

White Paper #4: Gold Beyond Belief

Every great earthquake begins with invisible pressure building beneath the surface. For years, the ground feels stable, solid — immovable. And then, without warning, the plates shift.

The calm shatters.

Bridges collapse.

Roads split open.

Foundations crumble.

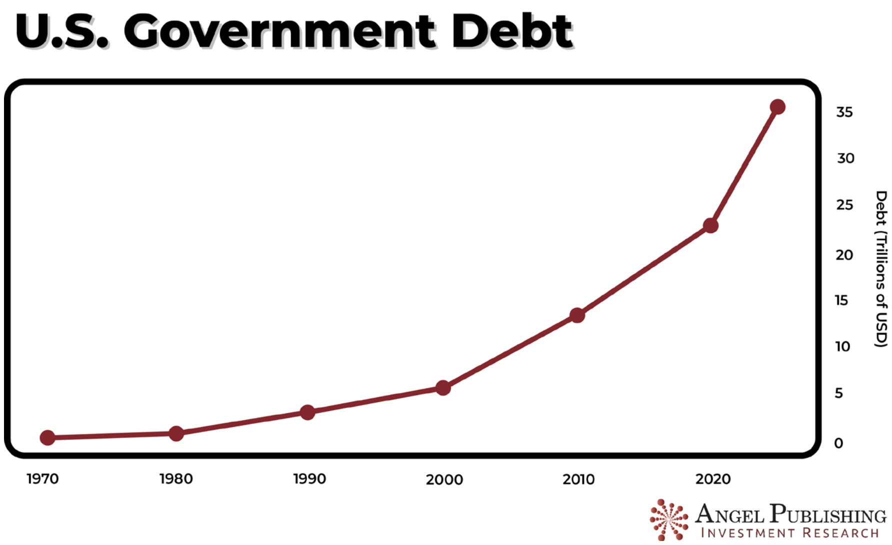
That's where we are today.

The financial system — the entire structure of modern money — is standing on fault lines so severe that when they snap, nothing will look the same.

Welcome to the **breaking point of the MoneyQuake.**

The Debt Supervolcano

The United States now carries over **$37 trillion in national debt.**



That number has become so large, so abstract, that most Americans shrug when they hear it. But let me translate:

- It's growing at more than **$1 trillion every 100 days.**
- Interest payments alone have surged past **$1.2 trillion a year** — more than the U.S. spends on its entire military.
- In less than a decade, interest will consume every federal tax dollar, leaving nothing for Social Security, Medicare, or defense.

That's not hyperbole. It's math.

And it's math that no longer works.

In the 1970s, when gold soared 2,400%, U.S. debt was under $1 trillion. Today, it's 37 times higher. Combine that with a slowing economy, runaway entitlements, and rising rates, and you don't have a "debt challenge."

You have a **debt supervolcano.**

The pressure is building. The magma is rising. And when it blows, it won't just scorch Washington — it will reshape global finance.

The Dollar's Fragile Throne

For nearly 80 years, the U.S. dollar has been the undisputed king of global trade. Oil, wheat, copper, cars — everything priced and settled in greenbacks.

That monopoly is cracking.

- **BRICS Challenge:** Brazil, Russia, India, China, and South Africa are openly discussing a gold-backed trade currency.
- **Petrodollar Weakness:** Saudi Arabia just let its 50-year agreement with the U.S. expire, meaning oil doesn't have to be sold in dollars anymore.
- **China's Shadow Moves:** Beijing has been quietly settling trade in yuan and gold — bypassing dollars.

Each of these is a fault line in the MoneyQuake.

It took decades for the dollar to rise to dominance. But as every empire learns, collapse comes fast. Ask Britain what happened to the pound after WWII. Ask Rome what happened when its denarius lost silver content.

Confidence is everything in currency. And confidence in the dollar is evaporating.

Central Banks in Panic Mode

Here's how you know the elites see the writing on the wall…

Investors who ignore what central banks are doing do so at their own peril. These institutions are not just regulators — they are the most **well-capitalized, politically connected, and strategically informed investors on Earth.** They control trillions in reserves, influence global liquidity through interest rate policy, and often move entire markets with a single policy decision or balance sheet shift. When a central bank acts, it's not speculation — it's a signal. They operate with the deepest research, direct access to governments and financial institutions, and advance knowledge of geopolitical and economic shifts before the public ever sees them.

If you want to know where the next major trend is headed, **watch what central banks are buying and selling.** When they hoard gold, it's because they see danger in fiat currencies. When they ease or tighten liquidity, it's because they're positioning for inflation or deflation before the rest of the world reacts.

In essence, central banks are the "smart money" behind the entire global economy, and when that money starts moving into hard assets like gold, it's not a trade — it's a strategy for survival. Following them isn't just smart. It's essential.

And right now central banks are buying gold at the fastest pace in over half a century.

- In 2022, net central bank gold purchases hit **1,136 metric tons** — the most since 1967.
- In 2023, another **1,037 metric tons** were added.
- And according to data from the World Gold Council, central banks **added about 1,045 metric tons** of gold to their reserves in 2024. To put that in perspective, that level of buying by central banks alone accounted for more than **20% of global gold demand** in 2024 — a striking share, especially given that their average share in earlier decades was much lower.
- China alone has been stockpiling for 17 straight months and now officially claims more than **2,300 metric tons** — though experts believe the true number is far higher.
- In 2025, central banks have continued buying gold… and now they're buying

silver!

Why are they doing this?

Because central bankers understand the quake better than anyone. They know the dollar's reign is ending. They know debt has reached terminal velocity. They know fiat confidence is collapsing.

And when the earth shakes, they don't want paper. They want metal.

Why?

Because you can't debase geology. Period!

The Social Fracture

But it's not just money.

Politics is fracturing. Culture is fracturing.

In America, elections are openly contested, institutions distrusted, and social fabric torn. Populism is rising in Europe. Emerging markets are drifting toward authoritarianism.

Everywhere you look, the glue that holds societies together — trust — is dissolving.

History shows that when social confidence cracks, monetary confidence is next.

When empires stumble politically, their currencies stumble financially.

This is not a coincidence. It's a cycle. And it's accelerating.

Inflation's Second Wave

The Fed may declare victory over inflation, but don't buy the spin.

The 1970s didn't have one wave of inflation — it had two. The first came with oil shocks in 1973–74. The second, more violent wave came in 1979–80, when inflation hit 14% and gold went parabolic.

Today, we're setting up for the same pattern:

- Food prices remain at record highs.
- Energy is volatile, with oil snapping back over $100 at every geopolitical flare.
- Supply chains are fragile, hostage to geopolitics and more recently pandemic lockdown shocks like we saw during COVID-19.

The first wave was 2020–22.

The second wave is ahead.

And when it hits, gold and silver will not just rise — they'll detonate.

Fault Lines Everywhere

Let's stack the evidence:

- **Debt supervolcano** ready to blow, with U.S. debt at $37 trillion and climbing and global debt at over $324 trillion and climbing.
- **Dollar throne** cracking under BRICS and trade realignment.
- **Central banks panic-buying gold** as insurance and now as MONEY.
- **Social fracture** eroding trust in governments and currencies.

- **Second wave of inflation** lurking just over the horizon.

That's not a market.

That's not a cycle.

That's a MoneyQuake.

Why This Matters for Investors

Most investors are sleepwalking.

They believe in 401(k)s, ETFs, and a polite 7% return.

They believe the Fed can control outcomes.

They believe Washington can print without consequence.

They're wrong.

Because once the quake hits, polite returns will be buried in rubble. Entire asset classes — bonds, fiat cash, overvalued tech — will collapse into crevices.

The survivors will be those who positioned themselves in advance, who understood the fault lines, who got to the good, green grass before the stampede.

What Comes Next

This is just the first chapter.

- **In Part II: The Great Gold Awakening**, we'll dive into how central bank hoarding, retail demand, and historic ratios point to a gold reset unlike anything since the 1970s.

- **In Part III: The Era of Scarcity**, we'll reveal how Peak Gold is starving supply and why majors are circling stranded trillion-dollar deposits.

- **In Part IV: The Digital Gold Revolution**, we'll show how tokenization turns geology into instant liquidity.

- **And in Part V: Beyond Belief**, we'll put numbers on it: $48,571.43/oz for gold, $825/oz for silver — the epicenter of the MoneyQuake.

The ground is already trembling.

The quake has begun.

The only question is whether you'll be standing in the rubble — or standing on the green grass of the next financial era.

Part II: The Great Gold Awakening

White Paper #4: Gold Beyond Belief

If Part I was about the fault lines beneath our feet, Part II is about the aftershocks you can already feel.

The ground is shaking. The dust is rising. And the smart money — the sovereigns, the elites, the insiders — are stampeding toward the one asset that history has always trusted when empires wobble.

That asset is gold.

And make no mistake: The awakening has begun.

The Quiet Stampede

In the mainstream financial press, gold barely registers. CNBC might give it 90 seconds between segments on Tesla earnings or the latest AI stock darling. Bloomberg will write a paragraph when gold hits another all-time high.

But behind the curtain, something extraordinary is happening.

Central banks are buying gold at the fastest pace since the 1960s.

- In 2022, they bought 1,136 metric tons.
- In 2023, they followed with another 1,037 tons.
- 2024 kept the streak alive, with demand far exceeding new mine supply.

China, India, Turkey, Russia — they're not nibbling. They're feasting.

And here's the kicker: Many believe the official numbers understate the true hoarding. China, for example, admits to holding 2,300 metric tons. Independent analysts estimate it could be double that.

Why the secrecy? Because gold buying is a vote of no confidence in the dollar. And no nation wants to signal weakness before it has finished its stockpile.

This is a quiet stampede.

The central bankers know the quake is coming. And they're getting their lifeboats in place.

Retail Still Asleep at the Wheel

Contrast that with the average American.

How much gold do you think sits in the average 401(k)?

Almost none.

Wall Street brokers rarely recommend it.

Financial advisers dismiss it.

Your neighbor might buy a few coins on eBay, but that's about it.

And yet every time panic flares, retail demand explodes:

- In 2008, during the financial crisis, U.S. coin sales hit multi-decade highs.

- In 2020, during the COVID panic, dealers ran out of inventory.
- In 2024, with gold pushing past $2,400, the U.S. Mint rationed American Eagles.

This is the pattern. Retail doesn't buy early. Retail buys late, in a frenzy, when premiums surge and supply evaporates.

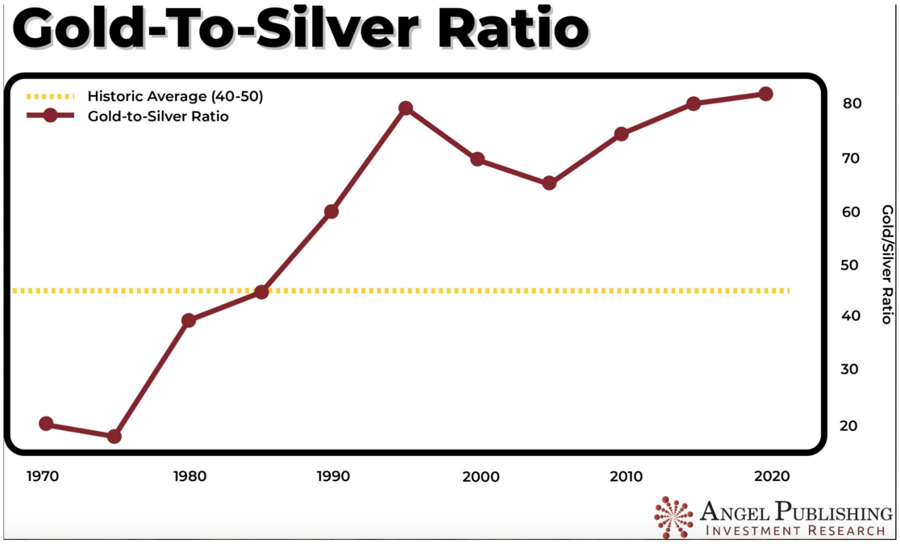
We are nowhere near that stage yet.

Which means the awakening is still in its early chapters.

Ratios That Scream Reset

One of the best ways to see the coming gold awakening is through historic ratios:

- **Gold-to-Silver Ratio:** Historically averages 40–50. Today, it's been hovering near 80. That means silver is criminally undervalued — a coiled spring waiting to explode.



- **Gold-to-Dow Ratio:** In 1980, at gold's last great peak, the Dow and gold were nearly 1:1 (Dow around 850, gold around $850). Today? The Dow sits above 45,000 while gold is $4,000. That's a 10.5:1 ratio. That ratio screams distortion — and a coming reset back toward equilibrium.

- **Gold-to-Real Estate Ratio:** In 1971, the median U.S. home cost 600 ounces of gold. By 1980, it cost just 150 ounces. Today? Roughly 120 ounces. That's another flashing signal: If gold repeats its 1970s surge, homes will be "repriced" in gold terms in shocking fashion.

Every ratio tells the same story: Gold is undervalued relative to everything else.

When the reset comes, these ratios will collapse back toward their historical norms — with gold doing the heavy lifting.

Wall Street Can't Ignore Forever

The awakening is not just central banks and retail. Eventually, Wall Street itself will have no choice but to pile in.

It's already starting.

- Gold equities — ignored for a decade — are quietly outperforming. The VanEck Gold Miners Index (GDX) is breaking out of multi-year bases.

- Junior explorers like IAMGold (IAG), Perpetua Resources (PPTA), and NovaGold (NG) are showing triple-digit runs in months, not years.

- Funds that once mocked gold are launching dedicated hard-asset strategies.

Wall Street hates gold — until it loves it.

And when it finally capitulates, the floodgates open.

Remember, the gold mining sector is tiny compared with tech, bonds, or even energy. A few hundred billion dollars in inflows is enough to send miners vertical.

I want you to remember this comparison. If you combined the market capitalizations of the top 100 gold mining stocks on the planet — I'm talking about Newmont Mining, Barrick, AngloGold Ashanti, Franco-Nevada etc. — it would total about $896 billion.

Now compare that with Nvidia, which has a market valuation of $4.5 trillion!

It's almost unbelievable — the combined value of the world's **top 100 gold mining companies**, representing every ounce of proven reserves and production across the planet, is worth **less than one-fifth of a single tech stock**, Nvidia. In other words, **an entire industry that underpins global monetary history and stores of wealth for millennia is valued less than one chipmaker riding an AI boom**. That kind of imbalance doesn't just hint at opportunity — it screams it.

This is the awakening no one on CNBC is talking about… yet.

The Silver Catalyst

If gold is the headline, silver is the exclamation point.

As we saw in the 1970s, silver doesn't just rise — it explodes. It overshoots, spikes, crashes, and still leaves investors richer than they ever imagined.

Industrial demand is off the charts:

- Solar panels, EVs, AI data centers, and 5G all devour silver.
- Supply is chronically short. The Silver Institute has reported multi-year deficits.

When retail finally wakes up, and when the gold-to-silver ratio normalizes from around 80 back to around 40, silver won't just play catch-up — it will leapfrog.

That's how you get from $25 to $825.

Not steady. Not smooth. Violent.

The Awakening in Context

So let's step back.

In Part I, we saw the fault lines: debt, fiat collapse, geopolitical fracture. The ground beneath our feet is splitting.

In Part II, we're witnessing the aftershocks:

- Central banks are hoarding gold like lifeboats.
- Retail is still asleep but poised for a mad dash.
- Ratios are flashing reset levels.
- Wall Street is preparing to capitulate.
- Silver is coiled like dynamite under pressure.

This is the Great Gold Awakening — the moment when the rest of the world finally realizes what you already know: Fiat is dying, gold is rising, and silver will go vertical.

What Comes Next

And this is just the second tremor of the MoneyQuake.

Because the real pressure hasn't even been released yet. That's coming in the supply side — the choke point that no one talks about until it's too late.

In **Part III: The Era of Scarcity**, we'll uncover the truth about Peak Gold, the vanishing pipeline of discoveries, and the trillion-dollar stranded deposits waiting to be unleashed.

When supply vanishes in the face of awakening demand, that's when prices don't just rise — they detonate.

And that's where we're going next.

Part III: The Era of Scarcity

White Paper #4: Gold Beyond Belief

In Part I, we mapped the fault lines — the debt volcano, the dollar's crack-up, the confidence collapse.

In Part II, we felt the aftershocks — the **Great Gold Awakening**, as central banks hoarded, ratios flashed reset, and silver coiled like dynamite.

But there's another force building beneath the surface — quieter, deadlier, and utterly inescapable.

It's not about demand this time. It's about supply.

Welcome to the **Era of Scarcity.**

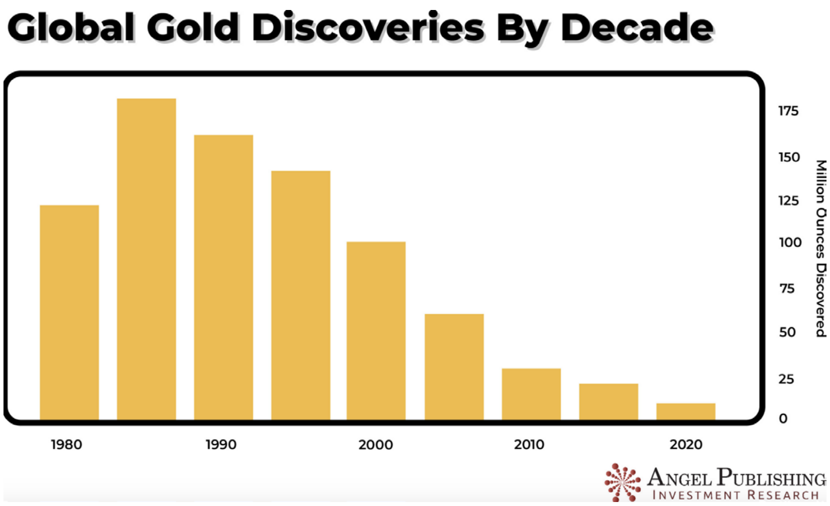
Peak Gold: A Reality Few Want to Admit

For decades, mining companies assured investors that new discoveries were just around the corner. Drill a little deeper, explore a little wider, and the world's insatiable demand would be met.

That was the myth.

Here's the reality:

- **New discoveries peaked in the mid-1990s**. Since then, the chart looks like a ski slope in free fall:



- The average grade of ore has collapsed. What miners once pulled at 10 grams per ton, they now scrape at 1 gram per ton or less.

- Global exploration budgets are shrinking, even as costs explode.

Geologists now openly admit: The world has already found most of the easy gold. What's left is remote, expensive, and politically toxic.

This is **Peak Gold.**

And like Peak Oil before it, the consequences are enormous.

The Permitting Nightmare

Even when companies do find a monster deposit, they can't touch it.

Why?

Permitting.

The average time to bring a major mine from discovery to production is now **15–20 years.**

Environmental reviews, lawsuits, community protests, ESG mandates — each adds another layer of delay.

Consider:

- **Pebble Creek (Alaska):** Over 100 million ounces in the ground. Stalled for decades by regulators and activists.
- **Donlin (Alaska):** Over 40 million ounces. Still waiting for full green lights.
- **Back Forty (Michigan):** Billions in potential value. Tied up in court battles.
- **Ruth (Nevada):** Vast reserves stranded by bureaucracy.

These are trillion-dollar vaults — locked and gathering dust.

And while they sit idle, demand is skyrocketing.

That's scarcity, weaponized.

The Cost Explosion

Even projects that get approved face brutal economics:

- Diesel, steel, cement — all inflating double digits.
- Skilled labor shortages are driving wages through the roof.
- Financing costs are surging as interest rates rise.

That means the break-even price for new gold projects is no longer $1,200 or $1,500 an ounce. It's pushing **$2,000** — and climbing.

Think about that. The launch point for this bull market is $2,000 — and that's the bare minimum new supply requires to even start.

The margin of safety is gone.

Majors Are Desperate

Look at the biggest gold producers — Barrick, Newmont, AngloGold. Their reserves are shrinking. Their production pipelines are drying up.

And they know it.

That's why we're seeing a frenzy of M&A — majors snapping up juniors, consolidating projects, fighting over scraps.

It's the same pattern oil majors went through during Peak Oil. When discoveries dried up, they didn't explore. They bought.

The same desperation is playing out now in gold.

Scarcity Meets Awakening

This is where the MoneyQuake gets violent.

Demand is waking up — central banks, retail, Wall Street.

But supply? Supply is shackled, stagnant, and shrinking.

That's not just bullish. That's explosive.

Economics 101: When demand soars and supply flatlines, price doesn't rise politely. It gaps.

That's how you get from $2,000 to $48,000.

That's how silver leaps from $25 to $825.

Not in a straight line — but in violent, breathtaking leaps.

Tokenization: The Escape Valve

There's only one "escape valve" in this scarcity era: tokenization.

Projects like NatGold don't require shovels, bulldozers, or blasting permits. They unlock value digitally, by certifying reserves and bringing them onto the blockchain.

It's a way to monetize geology without mining — to free stranded assets from bureaucratic purgatory and turn them into usable wealth.

And make no mistake: When scarcity collides with digital tokenization, the revaluation won't wait 20 years for regulators. It will happen instantly.

That's the opportunity most investors don't see yet.

The Scarcity Map

Think of it this way:

- Pebble Creek = America's Fort Knox underground.
- Donlin = A Nevada-style vault in the Alaskan wilderness.
- Back Forty = Michigan's buried treasure chest.
- Ruth = Nevada's forgotten crown jewel.

Together, they represent hundreds of millions of ounces — trillions of dollars in stranded value.

The moment one gets monetized — by a major, by a sovereign, or by tokenization — the dam breaks.

The market will realize scarcity isn't coming. It's here.

What Comes Next

So far, we've seen:

- **Part I:** The fault lines — debt, fiat, and geopolitics at the breaking point.
- **Part II:** The aftershocks — the awakening of central banks, retail, Wall Street, and silver.
- **Part III:** The scarcity era — Peak Gold, stranded vaults, cost explosions, and majors desperate for ounces.

This is the supply side of the MoneyQuake.

But the most revolutionary chapter is still to come. Because scarcity isn't the end of the story. It's the setup for something even bigger.

In Part IV: The Digital Gold Revolution, we'll show how tokenization rewrites the rules — and why the next trillion dollars in wealth won't be mined but minted.

Part IV: The Digital Gold Revolution

White Paper #4: Gold Beyond Belief

For the last three parts, we've walked through the anatomy of the MoneyQuake.

- **Part I:** The fault lines — exploding debt, a crumbling dollar, and a world at the breaking point.
- **Part II:** The aftershocks — the Great Gold Awakening, as central banks hoarded and ratios screamed reset.
- **Part III:** The supply crunch — Peak Gold, stranded trillion-dollar deposits, and majors desperate for ounces.

Each of these forces alone would be enough to ignite a bull market.

But now comes the most revolutionary chapter of all.

Because the MoneyQuake isn't just a financial tremor. It's a technological revolution.

It's the moment gold steps out of the ground, bypasses the pick and shovel, and becomes money again — in digital form.

Welcome to the **Digital Gold Revolution.**

The Prototype Was Bitcoin

Back in 2009, Bitcoin proved something profound: The world was ready to opt out of fiat.

It was ready to build wealth outside banks.

Ready to trust code over politicians.

Ready to transact peer-to-peer, borderless, censorship-resistant.

Bitcoin was the prototype.

But it had flaws:

- Backed by nothing but belief.
- Wildly volatile.
- Consumes as much electricity as a medium-sized country.

Still, the lesson was clear: People are starving for an alternative to fiat.

Bitcoin cracked open the dam.

Now gold is rushing through.

Enter Tokenized Gold

For the first time in history, gold doesn't have to be mined to be monetized.

Through tokenization, certified in-ground reserves can be verified, digitized, and fractionalized on the blockchain.

That means:

- A trillion-dollar deposit like Pebble Creek doesn't have to wait 20 years for permits.
- An ounce of Donlin's gold doesn't need a shovel, truck, or diesel generator to have value.
- Investors can buy, sell, and hold slices of real geological wealth instantly.

This is the **NatGold model** — the bridge between geology and digital money.

And it changes everything.

From Shovels to Servers

For 6,000 years, gold had to be mined, refined, and minted to function as money.

Now, in the age of blockchain, the rules are rewritten.

The mine is no longer a hole in the ground.

The mine is a digital ledger.

The reserve is no longer trapped by lawsuits and ESG protests.

The reserve is verified by geologists, certified by auditors, and tokenized for the world.

This turns stranded assets into liquid wealth.

It's like discovering a new Fort Knox — but this time, you don't need dynamite to open the vault.

Why Sovereigns Will Pounce

Make no mistake: This revolution isn't just for retail.

Sovereign wealth funds, central banks, and even governments themselves are watching.

Why? Because tokenized gold solves multiple crises at once:

- It strengthens reserves without mining's environmental battles.
- It offers a new trade settlement instrument outside the dollar system.
- It allows nations to hold wealth in a censorship-proof, portable format.

Imagine Saudi Arabia settling oil trades not in dollars, not in yuan — but in **tokenized gold**.

Imagine China doubling its reserves overnight by tokenizing verified but unmined deposits.

This isn't a dream. It's the inevitable next step of the MoneyQuake.

The Efficiency Shock

Here's the kicker…

Traditional gold mining operates on margins of 10%–20%.

Tokenized gold operates on margins of over **98%.**

Think about that.

Instead of burning billions of dollars on exploration, diesel, labor, and lawsuits… tokenization flips the switch instantly.

It's the most efficient business model in the history of gold.

No wonder early movers like NatBridge and NatGold are quietly positioning themselves as the "digital miners" of the 21st century.

When this becomes mainstream, the entire mining sector will be forced to adapt — or die.

Wall Street Can't Model This

Analysts don't know how to price tokenized gold.

Their spreadsheets are built for ounces in production, cash costs, capex.

How do you model a junior sitting on 50 million ounces that can be tokenized tomorrow?

How do you value a company with margins north of 90% and no permitting risk?

The answer is: You don't.

At least not with old models.

That's why early investors in digital gold plays will have an asymmetric advantage — buying before Wall Street even knows how to compute the upside.

Beyond Scarcity: Abundance of Value

Here's the paradox.

On the physical side, we're entering the Era of Scarcity.

But on the digital side, we're entering an Era of Abundance.

Not abundance of supply — abundance of access.

- Billions of investors worldwide will be able to buy tokenized gold with a swipe.
- Fort Knox-sized deposits will leap from "stranded" to "circulating" overnight.
- Liquidity will pour in, not from mining trucks but from blockchains.

This is how gold reclaims its throne — not as a bar locked in vaults but as a global, borderless, digital currency.

The MoneyQuake's Epicenter

If the debt crisis is the fault line…

If the Great Awakening is the aftershock…

If scarcity is the pressure cooker…

Then the **Digital Gold Revolution is the epicenter.**

It's where the plates actually shift.

It's where the old order dies and the new order erupts.

From this point on, gold is no longer just a commodity.

It's money again.

It's digital again.

It's sovereign again.

And it will be valued beyond belief.

What Comes Next

So far we've seen:

- Fault lines of debt and fiat collapse.
- Aftershocks of demand awakening.
- The chokehold of Peak Gold scarcity.
- And now, the epicenter: tokenization turning geology into instant money.

That leaves one final chapter: the shock wave.

In Part V: Beyond Belief — The Price Forecast, we'll put numbers to the quake.

$48,571.43 gold. $825 silver.

We'll show you why these aren't just targets — they're inevitable outcomes of the most powerful financial quake in modern history.

Part V: Beyond Belief — The Price Forecast

White Paper #4: Gold Beyond Belief

This is the moment we put numbers to the quake.

So far we've shown you the fault lines (Part I), the aftershocks (Part II), the supply choke (Part III), and the epicenter of tokenization (Part IV).

Now comes the shock wave.

And if you thought my old targets were bold, buckle up. Because the math you're about to see is so simple, so undeniable, and so explosive that it can only be described in one phrase: **beyond belief.**

Gold: The Precision Forecast

We're not going to play coy with ranges or polite percentages. We're going straight to history, running the math, and letting the numbers fall where they may.

- **Baseline (our 1971 launch moment):** $2,000/oz.
- **Historical model (1970s super-run):** Gold went from **$35** to **$850.**

That's a multiple of **24.285714x.**

Now apply that to today's baseline:

$2,000 × 24.285714 = $48,571.43

> That is not a guess. That is the precise, historical equivalent of the last supercycle applied to today's launch point.

Target for gold: $48,571.43 per ounce.

Write it down. Stare at it. Let it sink in.

That's what happens when $37 trillion in U.S. debt meets Peak Gold meets tokenization.

Silver: Two Engines, Two Targets

Silver is the wilder, more volatile cousin. It doesn't just run — it rockets. And it has two distinct historical models we can apply.

Model A: The 1970s Super-Run

Silver went from about **$1.50** to **$50.00.**

That's a multiple of **33.333x.**

Multiply that by our baseline of **$49.50:**

$49.50 × 33.333 = $1,650.00

> Target for silver (1970s analog): $1,650.00/oz

Model B: The 2001–2011 Secular Bull

Silver went from **$4.37** (2001) to **$49.80** (2011).

That's a multiple of **11.395881x.**

Apply that to **$49.50:**

$49.50 × 11.395881 = $564.10

> Target for silver (2001–2011 analog): **$564.10/oz**

Why These Numbers Matter

Think about this:

- At $48,571.43 gold, America's official 261 million-ounce reserve isn't worth $11 billion (as the Treasury pretends, using $42/oz). It's worth **$12.7 trillion.**
- At $564.10 silver, the global silver market — barely $1.3 trillion today — would suddenly rival the scale of entire sovereign bond markets.
- At $1,650 silver, you're not just talking about a monetary reset. You're talking about the revaluation of every EV, every solar panel, every ounce of industrial technology built on silver.

These aren't just asset prices. These are tectonic shocks to the entire global economy.

Why It's Not Fantasy

Critics will say these targets are insane. Outrageous. Impossible.

But the same critics laughed in 2004 when I said oil would reach $150 a barrel… when I said oil shale would boom, minting millionaires overnight… when I said gold would hit $2,000… and when I said silver would break out to $50.

The truth is simple:

- If gold once multiplied **24.2857x in the 1970s**, it can do it again.
- If silver once multiplied **33.333x in the 1970s**, it can do it again.
- If silver once multiplied **11.40x in the 2000s**, it can do it again.

Cycles repeat. Only this time, the launch point is higher, the debt is bigger, the dollar is weaker, and the technology to monetize gold is instant.

That's not fantasy. That's inevitability.

Wrapping It Back to the MoneyQuake

- **Part I:** The fault lines — the quake was inevitable.
- **Part II:** The awakening — the aftershocks have already begun.
- **Part III:** The scarcity — the pressure cooker is sealed tight.
- **Part IV:** The epicenter — tokenization flips the switch.
- **Part V:** The shock wave — prices reset beyond belief.

$48,571.43 gold.

$564.10 silver on a base cycle

$1,650.00 silver on a stretch cycle.

That's not just a forecast. That's the MoneyQuake's final wave.

The FAST-41 Winners Playbook: 3 Stocks With 10,000% Profit Potential

There's a moment in every historic bull market when the insiders are already counting profits while the public still thinks the race hasn't started.

This is that moment.

Because buried inside Trump's FAST-41 expansion order — the little-noticed piece of legislation that just vaulted mining projects to the front of the federal permitting line — lies the biggest opportunity we've seen in a generation.

The market has no idea yet.

Wall Street's algorithms haven't priced it in.

But we do.

And we've already identified three companies that could deliver the kind of once-in-a-lifetime returns most investors will never see. We're talking about the potential for 10,000% — the kind of gains that turn modest stakes into generational fortunes.

The Express Lane to Trillions

FAST-41 used to be about roads and bridges.

Now it's about *resources and power.*

Under Trump's expansion, critical-minerals mines are now classified as "Covered Projects" — giving them the same "express lane" permitting treatment as major infrastructure builds.

That means environmental reviews and federal agency approvals that once took a decade can now be completed in 24–36 months.

In bureaucratic terms, that's warp speed.

In financial terms, it's rocket fuel.

These newly minted FAST-41 projects are the spine of the next American industrial boom — feeding the AI revolution, crypto mining, quantum computing, and national security supply chains.

And only a handful of publicly traded miners have made it onto — or adjacent to — this list.

We've pinpointed three that are perfectly positioned. Each is sitting atop world-class deposits, is inside U.S. borders, is backed by the federal fast-track, and could potentially be re-rated 50x–100x as capital floods into the sector.

Let's break them down…

FAST-41 Winner #1: "The Gold-Copper Colossus" Trading for Just $1.50 a Share

The first company on our list controls a deposit so massive, so geologically stunning, it's been called "America's Fort Knox underground."

Tucked deep in Alaska's mineral belt, this project holds an estimated 107 million ounces of gold and 80 billion pounds of copper — enough to power half the planet's AI data centers for the next two decades.

For years, politics kept it shackled. Environmental red tape, lawsuits, and lobbying locked it in purgatory. But that was before FAST-41.

Now, under the new executive expansion, copper-gold projects with national security value are being fast-tracked — and this one's at the top of the queue.

Here's the math Wall Street will hate…

At today's prices, the metal in the ground here is worth over $2 trillion.

Yet the company controlling it trades at under $2 a share.

Do the math: Even a 5% revaluation of its in situ value would mean a share price 50 times higher. A full-scale development scenario under FAST-41's greenlit process? Try 10,000% upside — turning a $5,000 stake into half a million.

This is the kind of asymmetry only the FAST-41 era can create.

FAST-41 Winner #2: The $2-a-Share "Alaskan Titan"

The second company controls one of the largest undeveloped gold deposits on U.S. soil — over 20 million ounces of measured and indicated reserves in the heart of Alaska's new mineral corridor.

Its project is strategically located along the same logistical spine that's seeing federal build-out for military and energy infrastructure, making it a prime candidate for expedited treatment.

Under the previous regime, this deposit was uneconomic at $1,200 gold.

Under $2,500 gold, it becomes a printing press.

At $48,571 gold, it becomes a nation-state's treasure chest.

FAST-41 ensures this titan won't wait in line a decade to deliver.

Once it receives its environmental clearance — and we believe that will happen within 24 months — the re-rating could be seismic.

Our internal models peg the implied value per share north of $40–$50 (from current single-digit prices) in a middle-case scenario — and well over $100/share if gold pushes past $10,000.

In other words: 4,000%–10,000% upside.

And that's before tokenization, before sovereign partnerships, before the flood of AI infrastructure demand that will make gold and copper the new oil.

FAST-41 Winner #3: "The Uranium Revivalist"

While the first two plays feed AI's nervous system — copper and gold — this one fuels its heartbeat: power.

Uranium is the ultimate energy metal of the 2020s. The U.S. Department of Energy has already called it "critical to national security," and Trump's energy task force just moved to restore domestic uranium dominance through both stockpiles and new reactor funding.

Enter our third FAST-41 winner: a company now controlling dozens of permitted uranium mines and processing hubs across the U.S. Southwest.

Thanks to FAST-41 coordination, its Texas and New Mexico operations are being federally streamlined — cutting years off expansion timelines.

This company isn't looking for uranium. It's already mining it — and ramping production into a bull market where supply is imploding and prices have tripled since 2020.

Here's what the numbers say…

At $100 uranium, this company mints cash.

At $150 uranium, it doubles production.

At $250 uranium — which could hit by 2027 under the new nuclear renaissance — the market will have to reprice it by 2,000%–5,000%.

And in the grand-slam scenario — if the U.S. stockpile mandate and Trump's nuclear expansion converge — this could be a 10,000% gainer that funds America's next atomic age.

The Common Thread: FAST-41 = Re-Rating Event

Every bull market has its trigger.

In the 1970s, it was inflation.

In the 2000s, it was China.

In the 2020s, it's FAST-41.

By dragging critical-minerals projects out of bureaucratic limbo and into the light, Washington just turned the rarest assets in America into priority national infrastructure.

And when Washington declares something "critical," Wall Street follows.

First with analysts. Then with ETFs. Then with billions in capital inflows.

By the time the herd arrives, it's too late.

That's why we've spent months analyzing every FAST-41-eligible or pending mining project, cross-referencing them with public companies, and ranking them for upside potential, resource scale, and federal positioning.

Out of dozens, only three made the cut.

Why These 3 Could Be the Next 10,000% Winners

- They're domestic. U.S. soil. U.S. law. U.S. security. No geopolitical roulette.
- They're massive. World-class deposits that can single-handedly shift supply curves.
- They're early. Sub-$2–$5 share prices, pre-institutional accumulation.
- They're aligned. Each sits on the same federal priority list driving AI, crypto, and defense supply chains.

- They've got catalysts. Every one has a near-term event — a permit milestone, a funding infusion, or a tokenization partnership — that could ignite the next leg.

In a world where the U.S. is drowning in $37 trillion of debt and a collapsing fiat system, these companies hold the new collateral — tangible, verifiable, and federally fast-tracked.

They're the bridge between geology, technology, and sovereignty.

The Clock Is Ticking

Trump's FAST-41 expansion order is already in effect.

The Permitting Council has added waves of new mining projects to the Dashboard.

And the next wave — the one that could include our first two gold names and our uranium pick — is expected within weeks.

Once that happens, the market will wake up fast.

Analysts will initiate coverage. ETFs will rebalance. The algorithms will smell volume.

And the $0.10–$1 shares we're talking about here could be $5, $10, or $20 before the average investor even opens their brokerage app.

This is the window.

The last quiet stretch before the quake.

The FAST-41 Winners Playbook

I'm releasing a new report exclusively to a select group of readers…

It's called **"The FAST-41 Winners Playbook: 3 Stocks With 10,000% Profit Potential."**

Inside, you'll discover:

- The names and ticker symbols of the three companies I just teased.
- Exact price targets, entry zones, and upside projections.
- A timeline for the FAST-41 catalysts that could send each into orbit.
- My proprietary "MoneyQuake Trigger Score" — the single metric that predicts which juniors will go vertical first.
- And the detailed one-page briefings I send to my inner-circle investors.

The report is private. It's not for syndication. It will not appear on any website or public archive.

Only readers who act now — before the FAST-41 queue fills — will receive it.

Final Word

The world is re-rating hard assets.

The U.S. government just opened the express lane.

And the next leg of the MoneyQuake will mint fortunes for those already holding tickets.

Gold, copper, uranium — these are the pillars of the new age of energy and computation.

The three companies in **"The FAST-41 Winners Playbook"** are the early claim-holders on that future.

In the coming months, you'll see their stories flood the media, their stocks flood the screens, and their valuations explode.

But by then, it will be too late.

The time to move is now.

Because when the federal government hands you the keys to the front of the line, you don't wait — you accelerate.

And that's exactly what these FAST-41 winners are about to do.

You have two choices:

- Stand where you are, trusting fiat, trusting debt, trusting politicians — and risk being buried in the rubble.
- Or get to the good, green grass first — positioning yourself in gold, silver, miners, and digital tokenization before the stampede.

This is the last great wealth transfer of our generation.

The ground is splitting.

The walls are shaking.

The MoneyQuake has begun.

And the shock wave is headed straight for $48,571.43 gold and $1,650 silver.

Will you be ready?

The Ground Is Still Shaking

You've seen the fault lines.

You've seen the charts.

You've seen how Trump's FAST-41 expansion is pulling the pin on America's $300 trillion resource treasure chest.

Now it's time to stop watching the quake — *and start profiting from it.*

Because for the first time ever, I'm giving you **direct access to my full MoneyQuake Command Center** — the same system that's been identifying FAST-41 winners, AI energy catalysts, and tokenized-gold breakthroughs before they hit Wall Street's radar.

We call it:
The MoneyQuake Portfolio.

And it's not a newsletter.

It's not an advisory.

It's a **lifetime command center** — your headquarters for profiting from the fastest, most violent re-rating cycle in modern history.

Think of it as your control room inside the FAST-41 express lane — and sometimes *ahead* of it.

Where every alert, every chart, every trade is designed to **identify the next FAST-41 projects and presidential stake targets before they even hit the federal dashboard.**

Because by the time Washington updates the map, the biggest gains are already gone.

And when you join today, you'll get something extraordinary:

"The FAST-41 Winners Playbook: 3 Stocks With 10,000% Profit Potential"

This report is yours **FREE** when you take a risk-free trial of ***The MoneyQuake Portfolio.***

Inside, I name the three companies already sitting in the federal express lane — each positioned to multiply 50x… 100x… even 10,000% as Washington's mining fast track pours capital into the sector.

But the playbook is just your ignition key.

Because once you open it, you'll understand why the biggest fortunes in the next decade will belong to those who know **where the quake hits next** — and have the full arsenal ready when it does.

That's why I built ***The MoneyQuake Portfolio:*** to give you the tools, intelligence, and lifetime access you need to profit from every aftershock.

FAST-41 is the spark.

The MoneyQuake Portfolio is the **chain reaction.**

This is the only place I know of where you can see the next MP Materials, the next Lithium Americas, the next Trilogy Metals — before the headlines hit.

Inside the Command Center

When the plates shift, you don't wait for CNN to report it.

You want to be *at the epicenter* — before the crowd even feels the tremor.

That's exactly what ***The MoneyQuake Portfolio*** gives you.

It's not research for research's sake. It's your **real-time command center** for the FAST-41 era — where America's buried wealth is being revalued by the hour.

Here's What You Get the Moment You Join:

✓ "The FAST-41 Winners Playbook: 3 Stocks With 10,000% Profit Potential"

Your immediate briefing on three companies sitting directly in the federal express lane — the ones I believe could hand early investors 10,000% gains or more as the MoneyQuake intensifies.

✓ Full Lifetime Access to *The MoneyQuake Portfolio*

Three elite services bundled into one permanent membership: ***New World Assets, Extreme Opportunities, and Future Giants***. Each one is a live strike team aimed at a different profit vector in this supercycle — tracking the trades **most likely to become the next FAST-41 projects or presidential stake targets** before the rest of the market even knows they exist.

✓ The Critical Metals Dashboard

A private, members-only tracking system showing every FAST-41 project across America. The moment a mine gets fast-tracked, the moment the next update drops — you'll see it before Wall Street even knows what hit it.

✓ Real-Time Alerts and Tactical Briefings

When the government moves, we move first. Every new permitting milestone, executive order, or funding surge triggers instant alerts straight to your inbox. You'll know which stocks to buy, what prices to target, and when to take profits — with military precision.

✓ A 90-Day Risk-Free Trial

Explore every report, every service, every alert. If it's not everything I've promised — if it doesn't put you ahead of the next FAST-41 wave — you get your money back. No questions asked.

The Engines of the MoneyQuake

Inside ***The MoneyQuake Portfolio***, every component plays a precise role.

Each is a **live strike team** hunting a different profit vector in the supercycle — tracking the trades most likely to become the next FAST-41 projects or presidential stake targets before the rest of the market even sees the smoke.

Together they form the three engines that power the entire command center.

ENGINE #1 — *New World Assets*

The Proven Core. The Engine That's Already on Fire.

This is where my team and I go after the big metal veins feeding the AI, energy, and defense revolutions — the projects Washington is desperate to fast-track.

And the results speak for themselves:

- **267%** on GE Vernova (America's nuclear and grid renaissance)
- **518%** on U.S. Antimony (critical-minerals arms race)
- **120%** on ASP Isotopes (nuclear isotope supplier)
- **160%** on Perpetua Resources (pure-play U.S. gold security)

That's a **100% win streak**, averaging **117% gains per trade** and **1,414% cumulative open returns** — crushing the S&P (+13%), Nasdaq (+16%), and Dow (+9%).

Why?

Because **FAST-41 has collapsed timelines** that once took decades into months.

We're targeting the companies in that express lane *before* the crowd realizes what's happening.

When a project moves from rumor to Dashboard status, we're already positioned.

New World Assets is the foundation of your command center — steady firepower aimed squarely at America's resource renaissance.

ENGINE #2 — *Extreme Opportunities*

The Shock Wave Generator. One Asymmetric Trade Every Month.

This is where we pull the pin on the most explosive setups in the market — political catalysts, executive orders, buyouts, and capital surges from both Wall Street and Washington.

Every month you get:

✓ **One new elite trade** — timed for early entry and primed for asymmetric payoff.

✓ **10+ high-upside reports unlocked instantly** — including the hidden FAST-41 candidates.

✓ **Full vault access** — every past setup, every past victory, immediately yours.

Recent hits include:

- A U.S. gold miner sitting on a $500 billion deposit that **doubled in months.**
- A junior partner in a 39 million-ounce project backed by a global titan — **up 80%** in short order.
- A FAST-41-approved lithium play handing us **fast double-digit gains** with room to run.

And what's next?

Two plays on the **hottest metal on Earth right now** — rarer than gold and outperforming it 2-to-1.

One controls the **only major U.S. platinum deposit** (already cash-flowing with 25 million ounces).

The other sits on **600 million ounces** — the **largest resource base on the planet.**

Both are under Wall Street's radar… for now.

Extreme Opportunities is your monthly detonation switch — the shock wave generator of the portfolio.

ENGINE #3 — *Future Giants*

Where Small Stakes Become Empires.

Led by **Jason Williams** — *Harvard-trained and a former Morgan Stanley dealmaker who executed multibillion-dollar trades for some of the world's richest people*. This is where you plant tiny stakes in microcap explorers that can grow into billion-dollar powerhouses.

Think $10 million market caps scaling to $250 million… or $50 million breaking out to $500 million.

Jason's record speaks for itself:

- **1,390%** on Innovative Industrial Properties.
- **1,367%** on Twilio.
- **2,280%** on Nvidia (flagged under $40).

But what's more important is what he's doing *right now* in the MoneyQuake era.

He told readers to grab **MP Materials** — America's leading rare-earths miner — just **three weeks before the Pentagon announced a $400 million stake** to rebuild our domestic supply chain.

Result: **106% gains** for anyone who acted.

More recently, he spotted a **tiny California silver miner** trading just over a buck.

In a little over a month, it's already **up 92%.**

And that's on top of his current portfolio, stacked with double- and triple-digit winners, like:

> +35% in a day (Fission Uranium)

> +129% (Snowline Gold)

> +154% (Juva Life)

> +185% (QuickLogic)

> +276% (Mastech Digital)

> +1,168% (SoundHound AI)

Right now he's laser-focused on the resource arms race fueling gold, silver, uranium, and critical minerals — the very metals driving the FAST-41 surge.

- A $0.30 gold stock with a 73% monopoly on NatGold Tokens — controlling the first digital-gold supply chain.
- A billionaire-backed Newfoundland gold discovery (billionaire Eric Sprott also owns 23% of it).
- Fresh asymmetry across lithium, uranium, and rare earths — the same catalysts lighting up *New World Assets*.

This is where you **risk small but aim obscene** — the venture arm of your MoneyQuake command center.

Together, these three engines give you a **complete operational ecosystem:**

- The core (*New World Assets*)
- The shock wave (*Extreme Opportunities*)
- The moon shots (*Future Giants*)

When one fires, they all resonate.

And the profits compound like aftershocks rippling through bedrock.

Lifetime Access to the Fast Lane

You've seen the engines.

You've seen how each one fires.

Now imagine having *all three* — locked, loaded, and synced for life.

That's what you secure when you join ***The MoneyQuake Portfolio*** today.

This isn't another subscription. It's a **permanent command center** — a one-time partnership that gives you lifetime access to every elite research service we run in the FAST-41 era… and every new one we launch in the future.

Here's Everything Your *MoneyQuake Portfolio* Unlocks:

✓ ***New World Assets*** — valued at $3,499 per year.

Brian Hicks' flagship critical-minerals portfolio — the core engine already up triple digits across the board, with 117% average returns… zero losses… and the fastest-moving gains in Angel Publishing history.

✓ ***Extreme Opportunities*** — valued at $3,499 per year.

The shock wave generator — one asymmetric trade every month, timed to explode off Washington and Wall Street catalysts before they go public.

✓ ***Future Giants*** — valued at $3,499 per year.

Jason Williams' microcap engine — where tiny stakes turn into seven-figure windfalls in the FAST-41 supercycle.

✓ **Real-Time Critical-Metals Dashboard**

Track every project on the federal FAST-41 map — plus our "pre-dashboard" intelligence on the companies most likely to get added next.

✓ **Dedicated Member Services Liaison and VIP Phone Line**

Your direct link to the team — no queues, no guesswork.

✓ **Endowment Program**

Pass your lifetime membership to a family member whenever you choose, so the wealth can outlive you.

✓ ***Wealth Daily* and *Energy and Capital* E-Letters**

Daily intel streams to keep you tuned to every tremor of the MoneyQuake.

Annual Value: $10,497

Five-Year Value: $52,485

Your Price Today: One-time $2,999 + $39 annual maintenance fee — for life.

No renewals. No rebills. No fine print.

You pay once — and you own the command center forever.

That saves you **$7,498 in your first year** alone and tens of thousands in the years ahead.

Why the Lifetime Model Matters

Because this isn't a one-cycle trade. It's a monetary reformation.

The FAST-41 era will stretch through the entire resource renaissance — from gold and uranium to copper and AI metals.

And as the map updates, as new projects are fast-tracked, as new executive orders drop — you'll already be inside the room that moves first.

The MoneyQuake Portfolio isn't a product you buy. It's an advantage you keep.

90-Day Test-Drive Guarantee

Take a full 90 days to test every service, read every briefing, and see every alert.

If you're not thrilled with what you see — if you don't feel like you're in the fast lane to generational wealth — simply let us know.

We'll refund every penny.

You keep everything — **"The FAST-41 Winners Playbook,"** the reports, the research, the bonuses — as our thank-you for giving it a try.

No risk. All upside.

Why We Limit Enrollment

Because we're dealing with microcap and junior miners — stocks so small that an influx of too many buyers could distort prices and destroy the edge.

That's why this launch is strictly capped at **1% of our subscriber base.**

Once we hit that threshold, **enrollment closes immediately.**

No exceptions. No extensions. A waiting list only.

And at this price — the lowest we'll ever offer for lifetime access — that limit will be hit fast.

When that list fills, this page will shut down automatically — no reopens, no second chances.

Act Now to Secure Your Spot

The next FAST-41 map update could drop any week.

When it does, the projects we've been tracking quietly will go public — and the stocks could go parabolic within hours.

The express lane is open now. But it won't stay quiet for long.

FAST-41 is the spark. The MoneyQuake is the chain reaction.

And ***The MoneyQuake Portfolio*** is where you profit from both.

You Get:

- **Lifetime access** to three elite services — *New World Assets, Extreme Opportunities, and Future Giants* — a combined $10,497 annual value.
- **"The FAST-41 Winners Playbook: 3 Stocks With 10,000% Profit Potential" — FREE —** naming three stocks with up to 10,000 % potential.
- **Real-time access** to America's new **resource command center**, tracking every project before Wall Street catches on.

Click below now to claim your **FREE "FAST-41 Winners Playbook,"** lock in your lifetime seat, and step into the **fast lane to America's next resource fortune** — before the next tremor hits.

> Secure Your ***MoneyQuake Portfolio*** Membership Now

Or call **(844) 310-4115** and say, **"MoneyQuake Portfolio"** to reserve your spot.

I look forward to personally welcoming you to our elite inner circle…

Because when the earth moves this fast…

You don't wait for the dust to settle.

You **move first — and own the future.**

To your wealth,

Brian Hicks
Founder and President, Angel Investment Research
